Daniel Mugnier - Bolzano - 27/28 September 2007

#### WP3 Capacity building and training activities

\* Goal: To create a comprehensive set of training units and didactic material. For the participating countries, training courses will be prepared and evaluated through pilot courses.

Practical training

\* Audience : Supply side such as plant designers, engineers, technicians and installers

Real installation feedback

Daniel Mugnier - Bolzano - 27/28 September 2007

#### WP3 Capacity building and training activities

\* Task 3.1 Definition of standard training modules, development of a didactic material base and course concepts

Sources = <u>Experiences</u> (IEA task 25, CLIMASOL, KeepCool, ROCOCO, MEDISCO, IEA Task 38, SOLARCLIM2000,...) + Materials elaborated in WP 2

Production: Training materials on 6 fields.

- A) Available and most promising technologies
- B) Performance indicators, requirements on design and configuration
- C) Technical planning, implementation, quality assurance
- D) Available software and example calculations
- E) Environmental and financial aspects
- F) Realised systems and success stories

Daniel Mugnier - Bolzano - 27/28 September 2007

#### WP3 Capacity building and training activities

- \* Task 3.2 Implementation and evaluation of pilot training courses for professionals and technicians in the participating countries
- A) Organisation and implementation of two pilot training courses per partner country for professionals and technicians (DE, AT, IT, GR, PT, ES, FR, SI)

B) Evaluation of the training courses

C) Cross-country analysis

D) Improvement of the training contents and didactic materials

Daniel Mugnier - Bolzano - 27/28 September 2007

#### WP3 Capacity building and training activities

- \* Task 3.3 Production and distribution of training materials
- Didactic guidelines will be developed taking into account the most important knowledge for dissemination to the technical targeted groups.
- Content may differ for the participating countries according to the national requirements.
- Master version in English (electronic data base form) = basis for the preparation of the country versions.
- Materials available on the project website.

Daniel Mugnier - Bolzano - 27/28 September 2007

Project n° TREN/05/FP6EN/S07.54855/020094

Acronym: ROCOCO

Title: Reduction of costs of Solar Cooling systems

**Instrument: Specific Support Action** 

Thematic Priority: [6.1.3.1.1] [Cost-effective supply of

renewable energies]

Daniel Mugnier - Bolzano - 27/28 September 2007

#### \* Specific Support Action

\* 3 countries : Austria, France, Spain

Austria: Arsenal, Conness, Team GMI

France: TECSOL, Vivale

Spain: Aiguasol, Fototerm

\* **Duration**: **2 years** (May 2006-May 2008)

\* **Objective**: To identify ways to reduce the costs of solar cooling systems

Daniel Mugnier - Bolzano - 27/28 September 2007

#### Reduction of costs of Solar Cooling Systems

WPO: management, administration and coordination

**WP1**: state-of-the-art of the existing and upcoming solar cooling technologies => achieved and report available

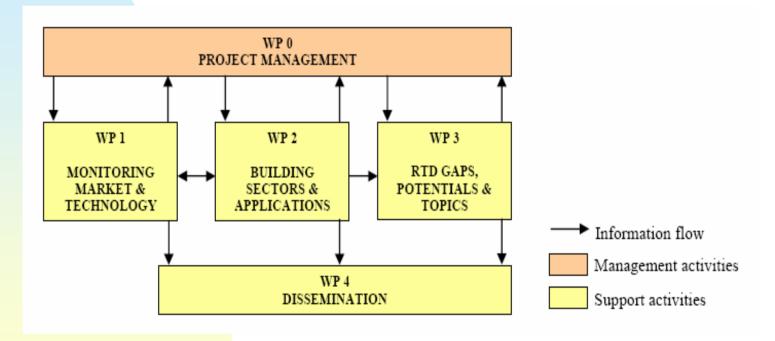

**WP2:** examination of building sectors, related to previous found applications, that have a high potential for the development of solar cooling technologies => ongoing

**WP3**: to identify elements that are still to expensive to lead to a market penetration of solar cooling systems (investment and operating costs for example) => ongoing

**WP4**: dissemination of project results => ongoing

Daniel Mugnier - Bolzano - 27/28 September 2007

Interaction plan the different tasks and activities

Daniel Mugnier – Bolzano – 27/28 September 2007

#### **Dissemination:**

- \* Presentations at conferences and other events (Task 38, OTTI, Derbi conf.)
- \* National expert seminar:

Pilot seminar in Austria at the 12th of July (KinG website)

France and Spain: end 2007/beginning 2008

\* Final conference

International Symposium about ROCOCO results

Spring 2008 combined with the 4th Project Management meeting

Possible co-operations: IEA Task 38, existing yearly conference in similar field

Daniel Mugnier - Bolzano - 27/28 September 2007

### **ROCOCO**: Cost Reduction for Solar Cooling Systems

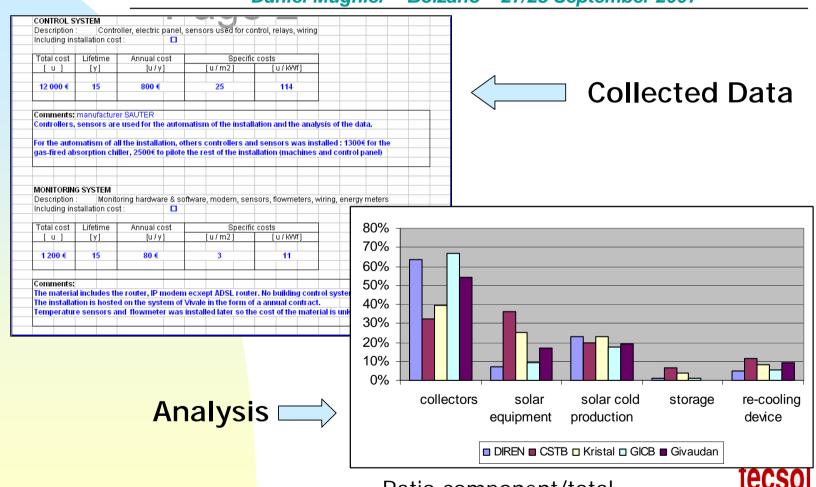

WP1: Data collection of past and on-going research project

- \* 95 installations in the World
- \* 15 questionnaires for transversal analysis
- \* 3 DEC solid, 1 DEC liquid, 2 adsorption and 9 absorption
- \* Good repartition
- \* 6 FPC, 1 AC and 9 ETC (22 m<sup>2</sup> -> 630 m<sup>2</sup>)
- \* Buildings: 1 hospital, 1 wine cellar, 1 hall and... 12 office buildings

Daniel Mugnier - Bolzano - 27/28 September 2007

Ratio component/total

Daniel Mugnier - Bolzano - 27/28 September 2007

### Conclusions to reduce cost (1/2)

process
wet cooling tower future?

installation overcosts collector field on tilt roof

involvment in the project

design choice of the site

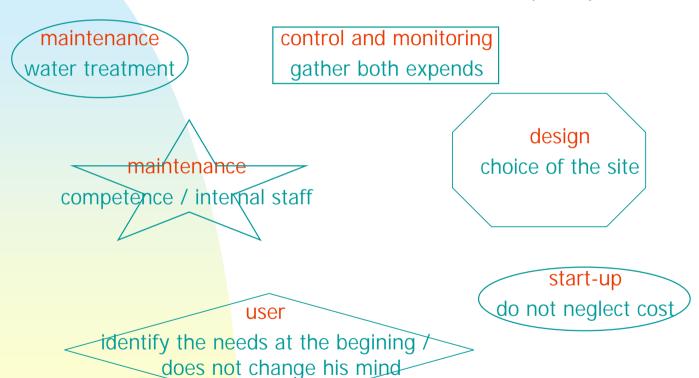

design...works...operation respect design calculation

operation
water and electricity
consumption

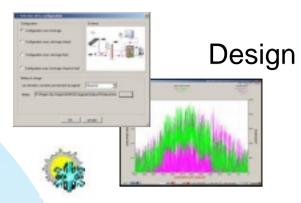

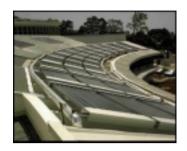

Daniel Mugnier - Bolzano - 27/28 September 2007

### Conclusions to reduce cost (2/2)

Technology

Building

SOLAR COOLING PROJECT Cost?

Operation

Installation, start-up

Daniel Mugnier – Bolzano – 27/28 September 2007

#### Main observations from ROCOCO

- Costs : Spain < Germany</p>
- Decrease cost while increasing performance
  - Equipment efficiency
  - Cold production / Energy demand
- Maintenance: internal and trained staff, doing monitoring
- Valorize hot water when no cooling needs

■ Daniel Mugnier – Bolzano – 27/28 September 2007

### Optimize design and planning cost

#### Design:

- Need for pre-selection tool (techno vs site, configuration)
- Need for simplified but robust design methods
- Need for best practice

#### Planning:

- Need skilled participant
- Need high level of engineering

From analysis of current installations, gather knowledge, create best practice and design tool.

Daniel Mugnier – Bolzano – 27/28 September 2007

Design: tips

- To optimize investment cost:
  - Select appropriate techology
    - Adso / Abso / DEC ?
    - ETC / FCP / Air / CPC
  - Design ratio
    - Collector area / kW cooling capacity?
    - Hot/cold storage capacity?
    - Hot/Cold back-up capacity?
- To increase performances:
  - Hot and Dry climate => better performances
  - Important DHW/heating needs

Daniel Mugnier - Bolzano - 27/28 September 2007

### **Project**: tips

- \* Standardized component are money and time saving
- \* Package solutions do not correspond to every project
- \* Appropriate system are the most efficient solution (time, money, energy)
- \* Installation should be as simple as possible (design, maintenance)

Should we garantee the performances..?

Daniel Mugnier - Bolzano - 27/28 September 2007

### Optimize material efficiency

... according its part in investment cost

#### Solar collector

- Possible in a long term period (high quality mean higher price BUT bigger future market)
- Take care of the efficiency curve, as function of radiation and temperature of the fluid
- Use research and studies about solar collectors results

#### 2. Chiller or desiccant process

- R&D projects
- Monitoring existing system
- Best practice

Daniel Mugnier - Bolzano - 27/28 September 2007

#### **Optimize installation cost**

#### Solar collector field →

- Heat pipe evacuated tube are easier to install
- In the south region, tilt of the roof are smaller (10 to 30°)
- Prefer flat roof
- Overcost due to installation constraint :
  - Security constraint for very high or very tilted roof
  - Structure reinforcement can be necessary

Select and assess the cost for solar collector field installation in the beginning of the project

Daniel Mugnier - Bolzano - 27/28 September 2007

#### Optimize start up phase

Control parameters, operating strategy →

- Need of studies and R&D project in control strategy and optimization
- Packaged installation should constitute already optimized solution
- Discuss the strategy with user & operating and maintenance staff
- Train operating and maintenance staff
- Used same material for control and monitoring
- Manufacturer should perfectly know their material

A lot of work (studies, engineering, research, optimization) has yet to be done. It is possible if monitoring current installations.

Daniel Mugnier – Bolzano – 27/28 September 2007

### Optimize operation cost

#### Re-cooling process

- = open wet cooling tower →
  - Analysis of the water: 3 times /year (France)
  - Water treatment: all the time (same price of water cost itself)
  - Maintenance staff: cleaning
  - Electricity consumption
  - Water consumption

Other kind of process to limit all this constraint (eg: river, swimming pool, industrial process, pre-heating...)
